The purpose of this study was to determine whether parents of adolescent inpatients perceive the same type of discipline that they provide their children in the home setting. In particular, the study examined whether the type of discipline perceived by parents in the home setting, the severity of discipline in the home setting, and the number of hours per week that the discipline was perceived to occur in the home setting are predictive of the form of discipline and duration of time spent in a hospital bed by adolescent inpatients. Subjects were 70 inpatients, aged 12-19, admitted to a general medical or surgical inpatient hospital ward. Parents were interviewed within 24 hours of the adolescent's admission and again approximately two weeks later. Results indicated that no differences existed in terms of the type of discipline, severity of discipline, or the amount of time spent in the hospital by inpatients of different ages. No differences were found in the duration of time in the hospital by inpatients of different ages. In fact, for the older adolescents, the longer they were hospitalized, the longer they stayed in the hospital.Q: How do I pull out a value from a string of numbers separated by pipes? So I have a string of numbers separated by pipes. I know what they are. I just don't know how to get a specific value out of the whole string. A: Is it always the same number of pipes separating the values? If so, you can use strtok(): char buffer[100]; char *ptr = buffer; char *end = buffer; strtok(buffer, "|"); // buffer now points to a series of tokens // tokens are separated by '|' // so buffer now points to the first token // tokens are separated by '|' // so buf[0] is the first value // tokens are separated by '|' // so buf[1] is the second value
