Investigation of five high-intensity focused ultrasound surgical devices for local therapy of bone tumours. High-intensity focused ultrasound (HIFU) is a promising non-invasive technique for tumour ablation. Using in vitro studies, the feasibility of HIFU as a method for ablating bone tumours is established. The aim of this in vivo study was to investigate the in vivo effectiveness of HIFU therapy for bone tumours. HIFU was delivered by five different devices: two HIFU devices with fixed focus, two HIFU devices with moving-focus and a single-shot HIFU device. Different types of in vitro irradiation techniques were performed and a rhesus monkey model was used to evaluate the in vivo effectiveness. The in vitro results demonstrate that HIFU can be used for ablating different types of bone tumours. The HIFU treated bone tumour models demonstrated ablation with a high degree of necrosis, however, the reproducibility of ablation size and extent was unsatisfactory for all devices, probably due to the dependence of the ablation size on the biological parameters of the treatment. The animal study showed that bone tumours could be ablated using HIFU, but no measurable damage was found in the skull bones of the animals. The HIFU device with moving focus (Sonata) has a lot of potential as a bone tumour treatment device. The design of the Sonata HIFU device and treatment techniques are highly appropriate for tumour ablation in the bone with a minimum of damage to the surrounding tissues. A never-

Improved graphics integration with PDFs As part of the PDF 64-bit release and related changes to the Open XML format, PDFs with embedded graphics can now be read by AutoCAD directly without converting to DXF or DWG. More powerful graphics integration with BMPs This change also applies to BMP images embedded in PDFs. Now you can use a combination of BMP and JPEG (or PNG) to take advantage of the image features in PDFs. Easier import of PNG images For vector images, including those created with Adobe Illustrator, you can now import PNG images directly into AutoCAD drawings. In addition, your drawings can now use these PNG images directly in PDF output. Advanced import of image and text In addition to supporting more vector image formats, AutoCAD now supports more content that it can import directly into drawings, such as .jpg or .png files. For the third time, you can now manually choose the drawing boundary, which allows you to import both the entire drawing and specific elements. Automatic extraction of attributes In addition to new graphics integration with PDFs, AutoCAD now includes more powerful support for editing embedded graphics in PDFs. Instead of just allowing you to read and copy, you can now import and export these graphics in an XML format, as well as get their attributes from the PDF. Improved DWG output with a model or drawing region You can now print, export to PDF, and even convert to DXF from a drawing that is based on a region. Read-only drawing mode With read-only drawing mode, you can turn on a drawing region to view only that region and hide all other regions. Improved AppWorkspace for easier sharing of drawings With the improved AppWorkspace, you can now share your drawings in a way that lets you choose your own personal preferences, such as the sharing of macros. Resize shapes and move points With better support for points and shapes, you can now quickly move and resize these shapes and gain instant visibility into the change. Saving of annotations In addition to being able to change a point's color or marker, you can now save annotations, including arrows and other drawing tools. Refine paths You can now easily refine the accuracy of the paths
