* Chapter 6 * If you're not sure whether to go for a general-purpose image editing package such as Photoshop, or a dedicated graphics application that lets you draw or design as you do in Illustrator or Fireworks, then consider checking out the latest version of Adobe Illustrator or Fireworks. These programs are intended for graphic designers and contain a lot of professional tools to help you create your images without relying on a graphics editing program. Both programs come with a full range of editing tools such as Gradient Maps and the ability to apply Opacity, Shadows, and Blur filters. They also have a drawing capability that lets you create your own assets.

Shop Adobe Photoshop Elements Photoshop Elements features Many basic features are the same between the two versions of Photoshop, including: Selection tools, Layers, Clipping masks, filters and the ability to rotate, mirror and flip images. Even if you are perfectly happy with Elements, you may choose to get Photoshop if you need to rotate, flip or mask a photo. The Photoshop website lists the following features for Photoshop Elements: Basic Camera raw support Basic artboard support Basic color management Basic desktop publishing Basic effects Basic retouching Basic text Basic 3D Basic web design Basic web publishing Basic video editing Basic vector graphics Basic video effects Basic Web Pushed Preview options Previous versions Photoshop Elements 6 and 5 had many fewer features than their professional sibling. Many of the features above were added in Photoshop Elements 8 and 9, such as Layers, Clipping Masks, Transform Masks, Track mattes, Distort and Map images, as well as basic adjustments to the RGB, grayscale, brightness and contrast of images. Basic image adjustments Basic image adjustments are the same as those in Photoshop. Layers and the Levels tool are two of the most useful features for image editing and image adjustments. Layers Layers are how you organize images in a photo editor. Each photo is a layer, which is usually the background image. If you want to separate an image into two areas, you would create two layers of that image, and then move each layer below the other in a layer panel. You can then place each layer below another, and use the layer tools to add shadows and shapes to each one. The Import New Background – Layer feature adds a new, empty layer to an image. You can then use the Spot Healing Brush, Spot Healing Brush, and other tools to edit the new layer. Creating Layers You can use the Make a Layer – New command to create a new layer. Select the menu option, Go to Layer, then New and create a new layer. Alternatively, you can right-click anywhere on the image. Choose Layer > New Layer, or just press Control + N. A new layer will appear and then you can use the layer tools to move, delete, resize, move and blur the new layer. a681f4349c

Ask HN: How do you keep track of new and unreleased iOS applications? - dsr12 I think most of the startups have side projects which they are working on. Also looking for any resources or guides. All the iOS applications i've seen so far are either released or they have a pending release. ===== thenomad A good approach is to have a 'finished' tag on the library version control repository for each app. When you're working on an app, simply merge to the main repository any commits you're doing that aren't ready to go live yet, but also don't commit them to the finished branch (eg, in the case of this branch, you'll merge the changes to the main repository when you're ready to do the merge). ----- sertad I just download the newest version of my favorite apps from the app store. If they're good, I'll use them. But i don't have that many apps to build a list of new apps. Does anybody have a list of apps which changed recently and their associated links? ----- codegeek I don't work on a start-up so never really got into this side project thing. I just started doing this recently to get better with xcode, write code and learn more. So here are some tips to get you started. 1\ Build a git repo for your apps. 2\ Download latest apps from the App Store. 3\ Now run them. 4\ Install them on your iPhone/iPad. 5\ If the app is not good/new/released yet, don't install it on your device(s). Just download the binary from the dev site. 6\ Build and distribute. 7\ Hit the app store. Now that's a lot of steps. You can do it in one swoop if you want: 1\ Build an app, upload to the app store. 2\ Get the binary/ipa from your app store. 3\ Install it on your iPhone/iPad. 4\ Run it. 5\ If it is not good/new/released yet, you can install/run it on your iPhone/iPad. 6\ If that binary is still there, hit the app store.
