The first generation of AutoCAD was a desktop app that could run on a single microcomputer. This product required a powerful microcomputer such as the TRS-80 Model III, which was released in 1980. The Model III, which was used as a desktop computer for CAD, and was the first microcomputer sold by Radio Shack. The first generation of AutoCAD required very large and expensive internal graphics controllers and support for multitasking. The second generation of AutoCAD was the first to use a multitasking graphics chip, such as the 256K-bit Video Graphics Array (VGA) chip used in the IBM AT-compatible personal computers, allowing AutoCAD to run in a graphical environment that was similar to the graphics on an IBM PC (IBM AT-compatible) personal computer. The third generation of AutoCAD was the first desktop app to use the QuickCAD format, which allowed users to draw parts or elements and then arrange those parts into a complete assembly. In addition, the first generation of AutoCAD was the first CAD program that could be used to generate 3D wireframe drawings. AutoCAD was originally written by Stephen P. Law, an engineer at the Digital Equipment Corporation, as an internal application for the DEC Rainbow 286. Its name was derived from "AutoCAD", a copy of "DYNA" (a predecessor of "Dyna"), used to display the internal matrix of Boolean equations. Law then hired Mark J. Puddephat in 1980 to write the first version of AutoCAD. As part of the development team, Puddephat chose to use a graphical user interface (GUI) with a mouse as the standard means of input. Law, whose background was in engineering, wanted to use the more powerful and sophisticated numeric user interface (NUI) that was in development at the time. His proposed GUI was a data-entry dialog-driven system, while Law's NUI was a command-driven system. This stalemate ended when Law left Digital to found the PARC (Palo Alto Research Center) group, a group of researchers working on the new Xerox Alto, a GUI personal computer designed by PARC. When Law was hired by PARC, he asked his former colleagues at Digital to help him write the GUI for the PARC computer, the Xerox Alto. By 1982, the Xerox Alto was built, and Steve Jobs, who was a

Plankton is one of the most important components in aquatic ecosystems, supplying raw material for the primary production of organic matter. Its abundance is determined by large scale phytoplankton dynamics, but also by the grazing pressure of zooplankton. Larvae of many zooplankton, including water fleas (Daphnia), play an important role in this phytoplankton removal, therefore maintaining the plankton succession. The question of how long they can be maintained in laboratory conditions is still open. For this purpose, a simple and cheap method for keeping the water fleas (Daphnia) in continuous culture was developed. In order to extend their maintenance time, other essential components of Daphnia development, such as food, oxygen and ammonium ions, were studied. A Daphnia Magna culture was set up in an aquarium, whose bottom was replaced by a tightly sealed lid. The Daphnia were fed with a fungus, and received only the minimum amount of oxygen necessary for maintaining the adult stage.DHAKA: Bangladesh is considering establishing an Islamic court to settle complaints against writers and bloggers over blasphemous material on the Internet, a government minister said on Saturday. Home Minister Asaduzzaman Khan said the government was working on a draft to set up such a court as the existing law is not suitable to deal with "vulgar" material on the Internet. Islamic courts, the minister told reporters, are only set up in countries with a predominantly Muslim population. "We are thinking about it," he said. "The law of the land is not suitable in our country and we are trying to evolve an appropriate law to deal with the matter." Critics say the government is being driven by the country's increasingly conservative religious lobby and is trying to control the Internet. Last year's publication of cartoons mocking the Prophet Mohammad by some French magazine drew global outrage. Several bloggers ca3bfb1094

What's New in the?

A 2D PDF or image included in a 3D model may be assigned to a reference object. This feature is useful if you want to incorporate a document into your drawing by creating a link or relationship between them. Adding reference objects is especially useful when it comes to designing printed labels. Reuse the part numbers, and trace the values of your existing drawings to create a faster and more accurate review. Parted Select: Select a set of parts to analyze or create a new part based on the position of the selection. Select only a single part or multiple parts to make a part out of them. (video: 1:13 min.) When starting with AutoCAD in 2D, often what you get is a flat picture of the world, not a 3D model. In this case, you can start with a selection that captures multiple parts, and use Parted Select to create a new part. 3D Modeling enhancements: Find a proper angle for an oblique view in three dimensions. You can now create or edit orientation parameters for your view, by choosing the view, then selecting an angle of view, then selecting the rotation parameters. The geometry of your view changes automatically according to the angles you've selected. (video: 1:13 min.) It is now possible to change the text color of axis labels. The AutoCAD settings for axis text can be adjusted to define which color to display. Change the transparency of 3D objects by adjusting the Opacity parameter in 3D Properties. Partitioning: Spatial and temporal partitioning is useful for splitting one drawing area into more than one drawing area. Create a region using spatial and temporal partitioning. Let the software create a new drawing area when working with a large drawing. New features in the Parts Manager: Export and import part files for use in other CAD applications. Create dimensions on the basis of external references or the dimensions of other objects. There's a new feature, name fields, to enhance the display of names in the Parts Manager. You can now search for a part by type, description or feature, and display the name, description and type of the part. Shape Memory: Select an existing shape or draw a new shape with no location. Then, assign
