Moving to iOS 12.5, Apple integrated the Photoshop Controls into the camera app. Unlike the earlier version of the Camera app, though, these features are exposed as Collections. If you've used earlier versions of the Camera app, then you may have more familiarity with Collections. With the new Collections, you can create multiple groups of adjustments (exposure, motion, white balance, color, masking), bar a few. You don't need to use the app to adjust your settings. You can take the same settings to the Camera app and make small edits there. Likewise, you can make these changes to multiple photos in one session. Apple's addition of multiple collections on the Camera app enhances the efficiency, while the ability to adjust a variety of collections within the app makes it easier to try out what you've made. Photoshop features a lot of possibilities with a list of tools as long as your arm. If you want to blur the background of a photo, or add more of it, you will find almost any filter available. If you need to resize an image, it is a snap. You can easily add frames and layers, or replace existing ones. If you're looking to add perspective distortion to a photo, you can do so painlessly. There are tools to correct vignettes and show you histograms and other technical information, and options are available to select specific colors and styles. You can create gradients and alter them with styles, and even create alpha items that you can apply to an entire group of images. Value control options may be found in any of the panels, and you will also find choices under "Tools". You can experiment using brushes, masks, adjustment layers, even paths, and there are dozens of choices to make an image look better.
